

IMPORTANT INFORMATION ABOUT LEAD IN YOUR DRINKING WATER

Wedgefield-Stateburg Water System found elevated levels of lead in drinking water in some homes/buildings. Lead can cause serious health problems, especially for pregnant women and young children. Please read this information closely to see what you can do to reduce lead in your drinking water.

Health Effects of Lead: Lead can cause serious health problems if too much enters your body from drinking water or other sources. It can cause damage to the brain and kidneys and can interfere with the production of red blood cells that carry oxygen to all parts of your body. The greatest risk of lead exposure is to infants, young children, and pregnant women. Scientists have linked the effects of lead on the brain with lowered IQ in children. Adults with kidney problems and high blood pressure can be affected by low levels of lead more than healthy adults. Lead is stored in the bones, and it can be released later in life. During pregnancy, the child receives lead from the mother's bones, which may affect brain development.

Sources of Lead: Lead is a common metal found in the environment. The main sources of lead exposure are lead-based paint and lead-contaminated dust or soil, and some plumbing materials. In addition, lead can be found in certain types of pottery, pewter, brass fixtures, food, and cosmetics. Other sources include exposure in the work place and exposure from certain hobbies (lead can be carried on clothing or shoes). Drinking water is also a possible source of lead exposure. Most sources of drinking water have no lead or very low levels of lead. Most lead gets into drinking water after the water leaves the local well or treatment plant and comes into contact with household plumbing materials containing lead. These include lead pipes, and lead solder (commonly used until 1986), as well as faucets, valves, and other components made of brass. Brass faucets, fittings, and valves, including those advertised as "lead-free," may contribute lead to drinking water. EPA estimates that 10 to 20 percent of a person's potential exposure to lead may come from drinking water. Infants who consume mostly formula mixed with lead-containing water can receive 40 to 60 percent of their exposure to lead from drinking water.

Steps You Can Take to Reduce Your Exposure to Lead in Your Drinking Water:

Steps	Reason
Run your water to flush out lead.	If water hasn't been used for several hours, run water for at least 15-30 seconds or until it becomes cold or reaches a steady temperature before using it for drinking or cooking. Note: You may want to capture the initial running water for uses other than drinking or cooking, such as for watering the plants.
Regularly clean faucet aerators	Remove particulate matter that may contain lead.
Use cold water for cooking and preparing baby formula.	Lead dissolves more easily into hot water.
Do not boil water to remove lead.	Boiling water will not reduce lead.
Look for alternative sources or treatment of water.	You may want to consider purchasing bottled water or a water filter. Be sure the filter is approved to reduce lead or contact NSF International at 1-800-NSF-8010 or www.nsf.org for performance standards for water filters.
Test your water for lead.	Call us at 803-774-3854 to find out how to get your water tested for lead, if any fees apply, and the location of labs that perform private testing.
Get your child tested.	Contact your local health department or healthcare provider to find out how you can get your child tested for lead if you are concerned about exposure.
Identify if your plumbing fixtures contain lead (replace, if necessary).	Brass faucets, fittings, and valves, including those advertised as "lead-free," may contribute lead to drinking water. The law currently allows end-use fixtures, such as faucets, with wetted surfaces containing a maximum weighted average of 0.25% lead to be labeled as "lead-free." Note: Prior to January 4, 2014, fixtures could contain up to 8% lead and be labeled as "lead free." Visit the NSF Web site at www.nsf.org to learn more about lead-containing plumbing fixtures.

What happened? What is being done?

During routine testing for the period of June – September, 2019, SCDHEC, detected lead above the action level in the water of two of the homes sampled. The action level for lead is .015 mg/l. The Wedgefield-Stateburg Water System had a 90th percentile lead level of .016 mg/l.

There are no lead materials in the water supply, storage or distribution system. To date there has been no lead detection in the Wedgefield-Stateburg Water System supply, storage or distribution system. The lead detection reported is from individual household plumbing at these specific locations.

Over the next several months, the Sumter County Water Utility will be evaluating methods for reducing or eliminating the exceedance in these homes and throughout the system if necessary.

For More Information call us at 803-774-3854. For more information on reducing lead exposure around your home/building and the health effects of lead, visit EPA's Web site at <http://www.epa.gov/lead> or contact your health care provider.

Public Education on Lead in Drinking Water

(Water system to fill in the blanks below)

Water System Name:
Wedgefield-Stateburg

Water System Number:
SC4320002

System Contact Info:
Name:
Jermaine Walker

Phone: 8037743854

Monitoring Period with Lead Exceedance:
June - Sept. 2019

Date Notice Distributed:
3/30/2020

Distribution Method:
By Mail

For Official DHEC BOW USE ONLY
